

Initial Context Layer: Shipment Losses, Claims, and Payouts

This document serves as an initial context layer breaking down the core logistics loss metrics, ongoing prevention initiatives, and automated payout frameworks discussed in the video.

1. Logistics Loss Categories

Logistics losses heavily impact the platform's Profit and Loss (P&L) statements, with roughly 8 crores per month attributed to these streams. Losses are divided into three main buckets:

Cash on Delivery (COD) Losses

- * **Definition**: Occurs when cash collected from users at the doorstep fails to reach the central company account.
- * **Value Chain Handshakes**: The cash moves from the **Rider** $\rightarrow$ **Hub Captain** $\rightarrow$ **Company**. Loop holes exist if a rider or captain absconds with the funds.
- * **Mitigation**: Security deposits are collected when a new captain opens a hub to offset potential cash leakages.

Shipment Losses

- * **Definition**: Loss tagged when a shipment becomes untraceable along the supply chain. It is further bifurcated into two types:
 - * **Hard Stop Losses**: Shipments stuck at a single facility that breach defined Service Level Agreements (SLAs). For instance, a shipment can stay at a hub for a maximum of 7 days before it is attributed as a localized loss to that specific hub.
 - * **Handshake Losses**: Discrepancies between two transitioning parties where the sender claims the package was handed over, but the receiver denies receiving it. Without a clear source of truth, attribution is highly complex.

Claims Losses (SX+ Claims)

- * **Definition**: Package outer shipment exists, but the internal contents have been swapped.
- * **Context**: Typically occurs in the return journey when a user hands over an incorrect or fraudulent product during a return pickup.
- * **Process**: Upon receiving the return, the seller raises a claim stating the product is wrong and requests reimbursement. The company compensates the seller and must subsequently trace the supply chain error to recover the lost value.

2. Loss Prevention Initiatives

COD Loss Prevention

- * **D-3 Policy**: Hub captains operate on a rigid "D minus 3" clearing policy. If outstanding cash from three days prior (\$T-3\$) is not deposited, the system halts manifestations—blocking any new orders from being allocated to that hub.

- * **Digital QR Payments**: Historically, Cash Management Services (CMS) agencies collected cash from hubs physically. This creates an opaque lag where an agent takes 2 to 3 days to report and clear balances. Captains can now scan dynamic, virtual-account-mapped QRs to settle COD dependencies in real-time.

- * **Doorstep UPI**: Encouraging end-users to pay via UPI at the doorstep lowers cash-handling risks. Users are incentivized via app-exclusive discounts valid until the shipment leaves the First Mile (FM) hub.

Shipment Loss Prevention

- * **Captain Panel Visibility**: A dedicated "Loss Management" tab gives hub captains real-time visibility into high-risk shipments. If a captain does not deliver or mark a return-to-origin (RTO) shipment within their SLA window, the system automatically flags it for a financial debit.

- * **Locator (CCTV Integration Pilot)**: To prevent handshake losses, the platform utilizes a third-party integration system named Locator.

- * Hub operators must scan a localized QR code to link a specific dock camera to a vehicle trip ID before loading or unloading.

- * Package scan timestamps are stitched together with continuous 24/7 CCTV video feeds. Support agents can physically count bags on-screen to verify if a missing bag was actually loaded or unloaded.

- * **QWB Inscription / Scan-to-Move**: Addresses "virtual departures," where a node operator manually types an Air Waybill (AWB) number into the system to clear their queue without physically moving the package. Manual typing is restricted during bag-sorting and dispatch flows. The new system decouples the QR from standard AWB strings, injecting a unique internal identifier token so that a package can *only* be processed if physically scanned.

Claims Loss Prevention

- * **Dual Scan Infrastructure**: Used primarily for branded or transparent packaging containing a unique vendor-printed barcode alongside the standard shipping label. The shipping label is digitally bound to the package's physical barcode at the time of seller pickup. If the label and the bag barcode do not match at later legs of the journey, a swap event is instantly recognized.

- * **Targeted Image Capture**: A Data Science (DS) propensity model flags approximately 2% of high-risk shipments. These flagged shipments mandate mandatory photographic evidence capture during critical handshakes (e.g., seller pickup, Last Mile hub, and user doorstep).

3. Payout Infrastructure & Automation

Payouts apply to four distinct external entities: ****Last Mile (LM) Captains****, ****First Mile (FM) Captains****, ****Pilots (Riders)****, and ****Transporters****.

System Evolution

Metric / Feature	Legacy System (1+ Year Ago)	Modern Automated System
Automation Level	100% Manual calculation via file uploads. Pilot payouts are 100% automated; LM Captains are automated and scaling. FM and Transporters are next in line.	
Processing Cycle	Took 12 days to clear from the close of a 10-day cycle (\$T+22\$ or \$T+23\$). Flexible \$T+C\$ concept for pilots, offering 1-day, 7-day, or 14-day frequencies. Roughly 40% of pilots choose the 1-day cash cycle.	
Loss Deductions	Adjusted manually via ad-hoc spreadsheet updates. Fully integrated infrastructure where marked shipment/COD losses automatically trigger a debit in the corresponding payout cycle.	
Earnings Visibility	Only visible to partners after the 22-day manual verification window closed. Visible on the partner application immediately past midnight for the previous day's metrics.	

System Logic Flow for Engineering Implementations

When building out payment adjustments or accounting tracking modules, the payout architecture operates on the following downstream engine loop:

- **Input Stage****: Ingests card/bank updates from onboarding, shipment data (delivered/picked up counts) from the core logistics ledger, and active loss penalties.
- **Computation Engine****: Runs a nightly localized batch query. It aggregates completed task yields, cross-references individual pilot risk holds (e.g., pending COD debt), applies incentives, and calculates the net payout minus calculated loss debits.
- **App Layer Sync****: Feeds real-time daily earnings and bucketing structures directly to the partner app interface.
- **Disposal / Transaction Stage****: Aggregates balances according to the user's selected payment cycle (1, 7, or 14 days), passes the batch via standard taxation/TDS logic, and initiates direct banking APIs.
